Email	allohspringere@icloud.com	Status	Functional, AI-integrated platform — live today

1 Presentation of the start-up and the project

Springer Finance is a Cameroonian fintech start-up founded and led by **Ngonjoh Springere**, the engineer who carried out the full development of the platform. The project is a **fully functional, AI-integrated web application** — live and demonstrable today, not a concept — that acts as an intelligent finance manager for households and small businesses: it records income and spending, reads paper receipts with computer vision, plans budgets, writes personalised financial advice, generates professional financial statements in one click, and distils every user's behaviour into a **Financial Health Score** — the foundation of a Cameroonian alternative credit-scoring system.

The world's most powerful AI is now available to whoever chooses to master it. Our conviction is simple: **Cameroon should not wait for foreign products to arrive — we leverage frontier AI ourselves, here, to deliver industry-standard financial services at Cameroonian prices.** Springer Finance was imagined, designed and coded entirely in Cameroon, by a Cameroonian, for Cameroonian realities — digital patriotism in working software.

2 The problem to be solved and the market opportunity

Most economic activity in Cameroon is informal and runs on cash and mobile money, leaving no written financial records. That single missing layer produces failures at every level:

- **Households fly blind.** Without visibility on spending, saving is accidental and month-end shortfalls are chronic.
- **Creditworthy people are refused loans.** A trader can run a healthy business for ten years and still be invisible to a bank: no statements, no records, no score — so the answer is collateral or refusal. Activities are denied credit not because they are unviable, but because they are **undocumented**.
- **Professional accounting is unaffordable** for households and micro-businesses; foreign finance apps assume foreign banks, foreign currencies and habits that do not survive a busy market stall.

The opportunity: smartphones and mobile money have reached nearly every neighbourhood — the payment rails exist, but the **intelligence layer is missing**. Whoever provides that layer gives millions of people an affordable accountant, and gives lenders the verified records they need to say yes. That is the gap Springer Finance fills — and it is also a national priority: financial inclusion and the progressive formalisation of the informal economy.

3 The innovative factor — AI doing industry-standard work

Artificial intelligence is not decoration in Springer Finance: it is the workforce. Every feature below is operational today and delivers work that normally requires a paid professional:

3.1 — The AI analysis engine

- **AI receipt scanning (computer vision).** Photograph any paper receipt and the AI extracts the amount, date, merchant and category, and records the transaction. The single biggest reason people abandon finance apps — manual data entry — disappears.
- **AI financial advice.** The platform continuously analyses each user's real income and spending patterns, and every month an AI advisor writes three personalised, actionable recommendations in plain language — the kind of guidance a private banker gives wealthy clients, delivered to a market trader's inbox.
- **AI reports and statements.** Automated monthly financial reports by email, plus one-click generation of the three statements every credit committee asks for: **income statement, balance sheet and cash-flow statement** — accountant-grade documents for people who could never afford an accountant.

3.2 — Credit scoring, and its impact on loans

Every user's verified behaviour is distilled into a **Financial Health Score (300–850)**, computed from payment reliability, savings rate, balance buffer, spending discipline and history length. For the millions who have no banking history, this is a **financial identity built from evidence rather than collateral**. The impact on lending is direct:

- **For borrowers:** a documented score plus AI-generated statements turn an undocumented applicant into a bankable file — more approvals, fairer rates, no guarantor roulette.
- **For lenders:** objective, behaviour-based risk signals cut assessment costs and defaults, letting microfinance institutions and banks lend confidently to segments they currently refuse.

3.3 — The road to bank-grade scoring

Our roadmap connects Springer Finance, with explicit user consent, to **banks, microfinance institutions and mobile-money operators** through secure APIs. Each connection enriches the score with verified flows and repayment histories, making it progressively more accurate — the same evolution that made credit bureaus and open banking industry standards elsewhere, rebuilt on Cameroonian rails. The flywheel:

3.4 — Responsible AI by design

This edition's theme warns against AI deviations; Springer Finance is built as the counter-example. Every AI output is **validated before it reaches the user** — an unreadable receipt is rejected with a clear message, never silently invented. The AI layer sits behind authentication and anti-abuse rate limiting, every user's data is strictly isolated, and score data will only ever be shared with a lender on the user's explicit consent. AI serving citizens — safely.

4 Summary of the project

Operational today: multi-account management with real-time balances · full income & expense tracking with search, filters and bulk operations · AI receipt scanner · monthly budgets with automatic alerts at 80% · recurring-transactions engine · interactive dashboards and charts · one-click financial statements (income statement, balance sheet, cash-flow) · monthly AI report by email · Financial Health Score · secured authentication, isolated user data, rate-limited services.

Technology: modern, scalable stack — Next.js/React, PostgreSQL, cloud background jobs, Google Gemini AI (vision + language), hardened authentication.

Roadmap (12–24 months): (1) fully bilingual French/English interface, FCFA-first; (2) automatic sync with MTN Mobile Money and Orange Money; (3) Android app with offline mode; (4) SME module — invoicing and simple stock; (5) secure, consent-based API connections to banks and microfinance institutions for credit-readiness reports and ever-more-accurate scoring.

5 The target and beneficiaries

- **Households & salaried workers** — visibility, budgets, savings discipline.
- **Students & young professionals** — sound financial habits from the first franc.
- **Freelancers & informal traders** — real records without paperwork: photograph the receipt and move on.
- **SMEs** — statements, budgets and dashboards at a fraction of the cost of an accounting department.
- **Banks & microfinance institutions** — consent-based, verified applicant records and behaviour-based scores that lower risk and expand lending.
- **The nation** — financial literacy, financial inclusion, and a data-driven path to formalising informal activity.

6 The economic model

A **freemium model priced in FCFA and payable by mobile money** — the payment method our users actually hold:

Tier	Indicative price	What it delivers
Free	0 FCFA	Core tracking, budget, dashboard — drives mass adoption and trust.
Premium	≈ 1,500 FCFA / month	Unlimited AI scans, statements, Health Score, monthly AI report.
Business (SME)	≈ 10,000 FCFA / month	Business accounts, exports, invoicing & stock (roadmap), priority support.
B2B data services	Negotiated	Consent-based credit-readiness reports and scoring API for banks and microfinance institutions — the long-term engine of the model.

Marginal cost per active user (cloud + per-request AI) is a few hundred FCFA per month, leaving healthy margins at modest scale; free-tier costs are capped by built-in rate limits. Consumer subscriptions fund growth, while **B2B scoring services to financial institutions** — priced per report or per API call — scale with every loan decision in the market. Distribution: university ambassadors, traders' associations, and co-branding with microfinance institutions, where one demonstration ("photograph a receipt, watch it become accounts") sells the product.

7 The project team

Ngonjoh Springere — Founder, Product Lead & Full-Stack Developer. Ngonjoh carried out **the full development of Springer Finance end-to-end**: product design, user interface, backend services, database architecture, AI integration (computer vision and language models), security hardening and the automated reporting pipeline. Delivering a production-grade, AI-integrated fintech platform single-handedly demonstrates rare end-to-end engineering capability and total command of the product.

- **Core skills:** JavaScript/React/Next.js · Node.js · PostgreSQL & Prisma · cloud services & background-job orchestration · applied AI · product design · cybersecurity best practices.
- **Contact:** +237 6 50 26 34 45 · allohspringere@icloud.com

As the start-up grows, the immediate recruitment plan adds a growth/community manager, a finance-domain advisor and a mobile developer — roles the economic model above is designed to fund.

Springer Finance is Cameroonian intelligence — human and artificial — put at the service of every franc Cameroonians earn: recorded by AI, understood through AI, and turned into credit and opportunity. We ask the jury for the chance to scale it to the millions who need it.
